

The Modern Concrete Villa Interior and Exterior Design

27 December 2022

Rating:

Designing with no limits is every architect's dream, and when it's combined with nature, like this project, it turns to something special. Our designers tried to do their best in creating something unique yet simple to combine with its surrounding.

Open space and Semi-open space are used in this project to create different experiences for the user. They can be used in different weather conditions to enjoy the beautiful natural surroundings of the project.

The client wanted spaces that flowed from the inside out, and that would "involve the site and surroundings into space while retaining a sense of protection for the users."

As you can see in the architectural renders, the villa was designed as a calm concrete block. The façade was designed with the material combination of white concrete and stone, their colors to make a significant volume. The terrace on the upper floor which is exactly cut out within the volume and the different set window openings, as well as the changing of the façade material to glass, gives the rather simple and sharp cut volume a thrilling and cool architectonic expression.

Unlike the building façade, the south side of the villa is mostly open. The large glass openings merge interior and beautiful exterior surroundings as much as possible and give the villa the ability to use the maximum possible natural light in the interior space.

The combination of concrete and glass materials is like a surreal experience where you can imagine the white concrete blocks are floating in the air. The outside pool is a great feature for the villa and can enhance the air ventilation and temperature in the house. It also provides a great playing area for the kids.

The flooring for is slab stone parquet both for interior and exterior space, this technique of choosing the same material for different spaces helps the user to create the connection between them mentally and feel like they are in the terrace while they are enjoying the controlled climate of the inside. The chosen materials enhance the aspired monolithic expression.

By placing the large windows in the concrete walls, the thickness of the material is visible. Therefore it reveals the compactness of the building's shell.

The dining table is also chosen in stone material and placed in front of the terrace window which allows the owners to open the windows in warm seasons and have a great time eating their meals.

In our opinion, panorama view is, a great way to present a project to potential clients, providing a complete understanding of the spatial impact of your project directly and uniquely, without requiring a deep knowledge of the technical drawings.

When you think of enjoyable and relaxation spaces during the warm-weather months, homes at the beach or in the country immediately come to your mind.

There's always something attractive about summer and the beautiful outdoor spaces that come with it. This terrace is a place where you can sit in a luxuriant space while enjoying a view that's dominated by a sea of trees, or take your morning coffee with a panorama of the land from higher than ground level. We believe that a house in a beautiful landscape needs enough open space to feel its surroundings.

To enhance the interior and exterior connection, floor to ceiling windows are selected. These windows bring the breathtaking outside natural environment inside the house. The windows frames are in harmony with tree trunks, as they merge with the vertical pattern of trunks.

As you can see in the architectural rendering outcomes the terrace has a special design and, combined with its nature, instead of cutting a tree that was within construction area, we decided to combine it with a terrace and use it as a natural shade.

Interior space of this house is warm and cozy not like most of the modern spaces that are cold. Natural wood flooring connecting the outdoor forest to the interior space and simple furniture and accessories let you concentrate on nature through the floor to ceiling windows.

Proper lighting is also completing this beauty, an organic shape chandelier in the middle of the space for the main light and spotlight in the ceiling for focused and area lights.

The most attractive rooms in our homes are usually rooms with the largest openings. We believe that during the daytime the sunshine can improve the bedrooms atmosphere, but it's very important to consider right curtains to be used during the night or when you need darkness to prevent excess light

from the outside and thick cream color curtains will properly do same in this project. There's something so cheering and fascinating about floor to ceiling bedroom windows.

Some of our clients prefer to have the openings behind their bed while many like to stare surrounding landscape as long as they're resting in their bed. It's a personal choice, but in this project and we can say that the best choice was the floor to ceiling windows in front of the bed looking to the dense and beautiful forest whether you are designing in nature like this project, or the urban landscape, we are a fan of large windows in the bedrooms.
